Project Title	**Predicting IMF-Based Exchange Rates: Leveraging Economic Indicators for Accurate Regression Modeling**
Maximum Marks	3 Marks

Project Proposal (Proposed Solution) report

The proposal report aims to propose developing a robust regression model to predict exchange rates using IMF data and key economic indicators. By preprocessing the data, selecting impactful features, and employing advanced regression techniques (e.g., linear, polynomial, machine learning models), we aim to enhance prediction accuracy. The model's performance will be evaluated using metrics like MAE, MSE, and R-squared, and validated with cross-validation. Finally, we will deploy the model in a user-friendly interface for real-time predictions. This solution leverages comprehensive data analysis to provide accurate and actionable exchange rate forecasts.

Project Overview

Objective	Improve prediction accuracy by identifying the most informative economic indicators and leveraging their relationships with exchange rates.
Scope	This project scope focuses on developing a predictive model that leverages economic indicators to accurately forecast IMF-based exchange rates, enabling informed decision-making in international finance and trade.

Problem Statement

Description	Predictive model for IMF-based exchange rates using economic indicators (GDP, inflation, interest rates, trade balances) and regression techniques, enabling informed decisions in international finance and trade.
Impact	The project's impact is significant, as it provides a reliable tool for predicting exchange rates, enabling informed decision-making and reducing financial risks.

Proposed Solution

Approach	This approach follows a systematic and data-driven methodology, leveraging regression techniques and economic indicators to develop an accurate predictive model for IMF-based exchange rates.
Key Features	1. Regression Analysis: Employs regression techniques to build a predictive model. 2. IMF Exchange Rates: Focuses on predicting IMF-based exchange rates. 3.Data-Driven Approach: Uses historical data to train and validate the model.

	- Real-time decision-making for quicker loan approvals. - Continuous learning to adapt to evolving financial landscapes.

Resource Requirements

Resource Type	Description	Specification/Allocation
Hardware		
Computing Resources	CPU/GPU specifications, number of cores	T4 GPU
Memory	RAM specifications	8 GB
Storage	Disk space for data, models, and logs	1 TB SSD
Software		
Frameworks	Python frameworks	Flask
Libraries	Additional libraries	scikit-learn, pandas, numpy, matplotlib, seaborn
Development Environment	IDE	Jupyter Notebook, pycharm
Data		
Data	Source, size, format	Kaggle dataset, 614, csv UCI dataset, 690, csv
